THE LEADING PROVIDER OF OUTPATIENT IMAGING SERVICES IN SAN DIEGO COUNTY INTRODUCES NEW PET/CT SCANNER

The GE Discovery ST is designed to help physicians diagnose and localize cancer faster than ever before. Discovery ST imaging technology combines today's most sophisticated positron emission tomography (PET) and computed tomography (CT) systems, producing images that provide anatomic and metabolic information that result from a single exam in a single system. Discovery ST's PET contains the ideal blending of technological components down the line that add up to optimized PET performance.

SOME REASONS FOR THE USE OF PET/CT:

- PET/CT has the unique capability to detect abnormal tumor metabolic activity before any anatomic change occurs on conventional imaging.
- When performed after the initial diagnosis of cancer, PET/CT is a sensitive staging tool to help determine the best form of treatment in adults and children.
- PET/CT is superior to conventional imaging in detecting distant metastatic and recurrent disease, and in monitoring response to therapy.
- PET/CT can help in differentiating malignant from benign disease.
- PET/CT can help when conventional imaging and histopathology fail to identify a primary tumor site.
- PET/CT can help in the diagnosis of certain degenerative neurologic disorders such as Alzheimer's Dementia.
